Absolutely. It's all it's all a game to them. The tabulation system, you know, a lot of our election officials think they go through this thing called the LOGIC AND ACCURACY TEST.

The screenshot shows a video player with a dark background. At the top, the title "Current Election Ecosystem (High-Tech Manipulation)" is displayed in white. Below the title, several election processes are listed with their associated vulnerabilities:

- Voter Registration – Controls # of Ballots in Circulation**
 - Mail Ballots – Creates a inventory of ballots with real-time tracking by select people/orgs
 - Early Voting – Provides time to monitor then inject votes undetected
- Voter Validation – Controls which Ballots get Counted**
 - Electronic Poll Books – Provides real-time tracking by select people/organizations
 - Signature Verification – Allows Ballots into the system with inadequate verification
- Tabulation – Controls how Ballots get Counted**
 - LAT/RLA – Provides false sense of accuracy/security to election officials and public
- Reporting – Controls what Totals we see**
 - Unofficial/Official Results – Provides time to cure any manipulation

At the bottom left of the video player, the logo "conservativedaily" is visible with the tagline "YOUR DAILY DOSE OF EMPTINESS". At the bottom right, the Rumble logo and video controls are shown, including a progress bar at 1:21:16 / 1:49:50.

And they say no, I went through the logic and accuracy test everything came out. Fine. Okay, but what they don't understand is the vendors came up with a logic and accuracy test. So our election officials are good hearted election officials going through this grueling test and they get the right answer. So they're proud that they did everything they were supposed to do, but what they don't know is the logic didn't actually test is a setup are being set up, build manufactured confidence in those systems. And then those poor election officials are passing that on to everyone else. It's disgusting. ...

Halderman Report: Dominion Machines Can Be Defeated During Certification Testing and Can Spread Malware Throughout a County ...

[Excerpts]: By Brian Lupo Jun. 19, 2023 8:29 am [198 Comments](#) ...

Logic and Accuracy Testing

The **Logic and Accuracy test (LAT)** is a public test that runs a selected number of ballots through the system to ensure it is properly counting the votes. Notably, in the 2020 Election, Fulton County, GA had to delegate the LAT to **Dominion themselves** due to a COVID outbreak at their English Street warehouse just before the election. They did this at the cost of \$2,000 per hour and \$5,000 per hour on Election Day, for a total of \$2 million.

The LAT is meant to ensure to the public that these machines are working effectively. There has been recent controversy regarding the 2022 primaries in Colorado, where Trump-endorsed former Mesa County Clerk Tina Peters lost to CTCL Board Chair Pam Anderson. A **controversial machine recount** was funded by the losing candidates in El Paso County. Despite a 53% rejection rate in the recount's LAT prior to the official recount, election officials **refused** a hand recount as an alternative after the controversial failure.

Fast forward to the report, Halderman outlines how the LAT can be subverted. **This is extremely concerning.** In Section 7.5 of the report, Halderman states that:

"... demonstration malware simply tracks how many ballots have been printed since the machine was turned on and skips cheating on the first n ballots (for an attacker-configuration number). If Georgia were to improve its LAT process by testing with a greater number of ballots, attackers could simply increase the number of ballots the malware skipped accordingly.

...

"No practical method of pre-election or parallel testing can rule out malware-based fraud. Although the QR code contains a cryptographic message authentication code (MAC) that scanners use to verify its integrity, **this poses no obstacle to the ICX malware."**

In Summary:

- The Halderman Report acknowledges that malware can be installed on these machines that would **undetectable** using Hash Validation testing

- Malware can subvert the Logic and Accuracy Testing and can “skip cheating” until the LAT is complete.
- No practical method of pre or parallel election testing would detect it
- Georgia has known about these vulnerabilities for two years, yet will not upgrade their machines until after the 2024 Election
- Georgia officials have fought arduously to prevent quality inspection of the physical paper ballots after numerous discrepancies were found mainly via Open Records Request in the 2020 and 2022 elections
- Georgia has previously updated all of their systems in less than a month's time, however, three and a half years is not sufficient for this imperative security update
- The vulnerable election software was used in 2022, while the Georgia Sec. of State was aware of the problem and was also a candidate in that contested election. ...

I (Bill Wiesner) attended the Elmwood Township “Logic & Accuracy” Test in 2023. I had just heard that some other citizens who attended similar tests in other parts of Michigan had been able to copy some of the test ballots and then successfully run them through the tabulator.

I mentioned this to Elmwood Township Clerk Connie Preston. She then said that copies of the ballots would be rejected if we attempted to run them through the tabulators. I then said, let's copy a test ballot and verify whether it could be successfully run through the tabulators. She then said that we were not allowed to do that.

Any valid “Logic & Accuracy” Test should be willing to look for weaknesses and then actively run tests to see if the black box voting machines can be hacked in any way. That's exactly what Michigan University's Professor J. Alex Halderman did when he successfully hacked into Dominion Voting Black Box Machines in Georgia, where he found so many vulnerabilities.

To just go along with some voting machine “Logic & Accuracy” test that was developed by Dominion Voting Systems (Eric Coomer?) without allowing outside independent experts (like Professor Halderman) to test them, is just like allowing the Fox to guard the Hen House.

By the way, the www.LetMyPeopleGo.movie DVD shows clips of Dominion Voting Machine President John Paulos saying over and over again that Dominion Voting Machines are not online; it also shows clips of Eric Coomer, Dominion Voting Machines Vice President of Strategy & Security, describing the voting machine modem and the network carriers (Verizon, AT&T, and Sprint, etc.) that they can go online with. So, who do you think was telling the truth: John Poulos or Eric Coomer?
